

CLAIM AMENDMENTS

1. (Currently Amended) A servo controller comprising:
~~an~~ a finite impulse response (FIR) filter unit for correcting a position instruction signal;
a mechanical characteristic compensation unit for attenuating components, each component having a predetermined frequency and ~~each~~ corresponding to a characteristic of a target machine to be driven, and which are included in the position instruction signal corrected by said FIR filter unit, ~~so as to compute~~ and computing a plurality of feed-forward signals respectively associated with a position, a speed, and a torque of ~~said the~~ target machine; and
a feedback compensation unit for driving ~~said the~~ target machine ~~to be driven~~ according to the plurality of feed-forward signals respectively associated with the position, the speed, and the torque of ~~said the~~ target machine and computed by said mechanical characteristic compensation unit.
2. (Currently Amended) The servo controller according to Claim 1, wherein said mechanical characteristic compensation unit comprises
a position instruction computation unit for attenuating a component having an antiresonance frequency of ~~said the~~ target machine ~~to be driven~~, and which is included in the position instruction signal, ~~so as to compute~~ and computing the feed-forward signal associated with the position of ~~said the~~ target machine,
a differentiator for differentiating the position instruction signal,
a speed instruction computation unit for attenuating a component having the antiresonance frequency of ~~said the~~ target machine ~~to be driven~~, and which is included in a value computed by said differentiator, ~~so as to compute~~ and computing the feed-forward signal associated with the speed of ~~said the~~ target machine,
a computation unit for differentiating the value computed by said differentiator to produce a differentiated value, and for multiplying the differentiated value by a total inertia of ~~said the~~ target machine ~~to be driven~~, and
a torque instruction computation unit for attenuating a component having a resonance frequency of ~~said the~~ target machine ~~to be driven~~, and which is included in a value computed by said computation unit, ~~so as to compute~~ and computing the feed-forward signal associated with the torque of said target machine.

3. (Currently Amended) The servo controller according to Claim 1, wherein said mechanical characteristic compensation unit comprises

a first-order delay filter for correcting the position instruction signal, said first-order delay filter having a time constant ~~that is set~~ according to ~~an~~ a damping constant, an antiresonance frequency, and ~~an~~ inertia of a load of ~~said the target machine to be driven~~ so that ~~an~~ influence of attenuation characteristics of ~~said the target machine to be driven~~ is reduced,

a position instruction computation unit for attenuating a component having the antiresonance frequency of ~~said the target machine~~ and which is included in the position instruction signal corrected by said first-order delay filter, in consideration of the attenuation characteristics of ~~said the target machine to be driven so as to compute, and computing~~ the feed-forward signal associated with the position of ~~said the target machine to be driven~~,

a differentiator for differentiating the position instruction signal corrected by said first-order delay filter,

a speed instruction computation unit for attenuating a component having the antiresonance frequency of ~~said the target machine~~ and which is included in the position instruction signal differentiated by said differentiator, in consideration of the attenuation characteristics of ~~said the target machine to be driven so as to compute, and computing~~ the feed-forward signal associated with the speed of ~~said the target machine to be driven~~,

a computation unit for differentiating a value computed by said differentiator so produce a differentiated value, and for multiplying the differentiated value by ~~a~~ total inertia of ~~said the target machine to be driven~~, and

a torque instruction computation unit for attenuating a component having a resonance frequency of ~~said the target machine to be driven~~, and which is included in a value computed by said computation unit, in consideration of the attenuation characteristics of ~~said the target machine to be driven, so as to compute, and computing~~ the feed-forward signal associated with the torque of ~~said the target machine~~.

4. (Currently Amended) The servo controller according to Claim 1, wherein said FIR filter unit ~~is provided with~~ includes at least two or more moving average filters, each moving average filter having a time constant ~~that is set~~ based on requested path accuracy.

5. (Currently Amended) The servo controller according to Claim 1, wherein said mechanical characteristic compensation unit comprises an n th-order filter (n is an arbitrary natural number) for correcting the position instruction signal, ~~the~~ said n th-order filter ~~having~~

~~a property of cutting off a component having a desired frequency.~~

6. (Currently Amended) The servo controller according to Claim 1, further comprising a position instruction correction unit for correcting the position instruction signal so that ~~an~~ influence of said FIR filter unit upon ~~a~~ gain of said FIR filter unit itself is reduced.

7. (Currently Amended) The servo controller according to Claim 6, wherein said position instruction correction unit corrects the position instruction signal by adding to the position instruction signal a value, that is obtained by multiplying the ~~differentiated~~ position instruction signal, after differentiation, by a coefficient ~~to the position instruction signal~~.

8. (Currently Amended) The servo controller according to Claim 1, further comprising

a simulated position control loop unit for computing a simulated speed signal according to both the feed-forward signal associated with the position of ~~said the~~ target machine and the feed-forward signal associated with the speed of ~~said the~~ target machine, which are computed by said mechanical characteristic compensation unit, and

a torque correction signal computation unit for computing a torque correction signal according to a change in ~~a~~ sign of the simulated speed signal computed by said simulated position control loop unit when ~~a~~ direction of rotation of ~~said the~~ target machine ~~to be driven~~ is reversed, and for correcting the feed-forward signal associated with the torque of said target machine, and which is computed by said mechanical characteristic compensation unit, according to the torque correction signal.

9. (Currently Amended) A servo controller comprising:

a differentiator for differentiating a position instruction signal ~~so as~~ to compute a feed-forward signal associated with ~~a~~ speed of a target machine to be driven;

a computation unit for differentiating a value computed by said differentiator to produce a differentiated value, and for multiplying the differentiated value by ~~a~~ total inertia of ~~said the~~ target machine ~~to be driven~~;

a vibration reduction filter for attenuating a component having a resonance frequency of ~~said the~~ target machine ~~to be driven~~, and which is included in a value computed by said computation unit, and for amplifying a component having an antiresonance frequency of ~~said the~~ target machine ~~to be driven~~, and which is included in the value computed by said computation unit, ~~so as to compute~~ and computing a feed-forward signal associated with ~~a~~

torque of ~~said the target machine to be driven~~; and

a feedback compensation unit for driving ~~said the target machine to be driven~~ according to the position instruction signal, the feed-forward signal associated with the speed of ~~said the target machine to be driven~~ and computed by said differentiator, and the feed-forward signal associated with the torque of ~~said the target machine to be driven~~ and computed by said vibration reduction filter.

10. (Currently Amended) The servo controller according to Claim 9, further comprising a position instruction correction unit for correcting the position instruction signal so that ~~an~~ influence of said ~~FIR filter unit~~ differentiator upon a gain of said ~~FIR filter unit~~ differentiator itself is reduced.

11. (Currently Amended) The servo controller according to Claim 10, wherein said position instruction correction unit corrects the position instruction signal by adding to the position instruction signal a value, that is obtained by multiplying the differentiated position instruction signal by a coefficient ~~to the position instruction signal~~.

12. (Currently Amended) The servo controller according to Claim 9, further comprising

a simulated position control loop unit for computing a simulated speed signal according to both the feed-forward signal associated with the position of ~~said the target machine~~ and the feed-forward signal associated with the speed of ~~said the target machine~~, and which are computed by said mechanical characteristic compensation unit, and

a torque correction signal computation unit for computing a torque correction signal according to a change in ~~a~~ sign of the simulated speed signal computed by said simulated position control loop unit when ~~a~~ direction of rotation of ~~said the target machine to be driven~~ is reversed, and for correcting the feed-forward signal associated with the torque of said target machine, and which is computed by said mechanical characteristic compensation unit, according to the torque correction signal.
